

# DAVID KALINA

Full-Stack Software Engineer · Colorado / Remote

davidkalina@proton.me · 385-225-6102 · davidkalina.com · linkedin.com/in/david-kalina · github.com/DavidKalina

## SUMMARY

Full-stack engineer with 4+ years building thoughtful systems across SaaS, logistics, and marketplaces. Deep in TypeScript, React, and Node.js, with a growing pull toward AWS, Terraform, and AI-powered tooling. I ship scalable, non-blocking software that cuts costs, holds up in production, and keeps the humans using it in mind.

## TECHNICAL SKILLS

|                       |                                                                          |
|-----------------------|--------------------------------------------------------------------------|
| <b>Languages</b>      | TypeScript, JavaScript, SQL, HTML, CSS                                   |
| <b>Frontend</b>       | React, Next.js, Vue, React Native, Tailwind, Storybook                   |
| <b>Backend</b>        | Node.js, Bun, Express, GraphQL, tRPC, REST                               |
| <b>Cloud / DevOps</b> | AWS (Lambda, SQS, S3), Terraform, Docker, CI/CD                          |
| <b>Data</b>           | PostgreSQL, PostGIS, Redis                                               |
| <b>AI Tooling</b>     | Vercel AI SDK, Anthropic Agent SDK, MCP, Claude Code, prompt engineering |

## EXPERIENCE

**Full-Stack Software Engineer** — Eel Data Systems, Colorado 2025 – Present

- **AI document pipeline:** designed and shipped an event-driven system (Vercel AI SDK, AWS Lambda, SQS, Terraform) that turns shipping PDFs into structured shipment data — using the AI SDK to define typed freight/BOL schemas for reliable extraction, processing ~3K documents/month at 99%+ success while cutting processing costs by 98% and saving \$20k+ annually.
- **Core product:** built and maintained the GraphQL API powering the TMS — ~2M requests/month on a right-sized ECS service with OpenTelemetry observability and 100+ production deploys, over a Supabase/Postgres data layer handling ~5M requests/month.
- **Feature delivery:** shipped quote-to-shipment conversion, line-haul quoting, and multi-column shipment search on the Vue web app, plus driver-app improvements (camera-roll BOL upload, in-app update prompts) across multiple App Store releases.
- **Performance debugging:** root-caused a compounding client-side polling defect where orphaned timers spawned unbounded GraphQL requests against the API, inflating backend load and forcing reactive auto-scaling; shipped a generation-token single-flight fix that eliminated the request snowball and the need for auto-scaling.
- **Infrastructure as code:** provisioned the full AWS stack with Terraform — serverless compute, queues, and storage — enabling non-blocking, asynchronous workflows at scale. Remote state in S3, applies gated behind a GitHub Actions runner.

**Software Engineer** — K-Optional Software, Colorado 2022 – 2024

- **Product delivery:** shipped production features across marketplace and SaaS products on a React / TypeScript / GraphQL / Node / PostgreSQL stack (Flowty.io — see Projects — and Alpha Fox / Revive Ratings, a white-label multi-tenant SaaS review platform).
- **Design system:** built and documented a Storybook-driven React component library adopted as the shared design system across multiple product teams; delivered Progressive Web Apps and mobile builds to extend product reach beyond the browser.

## SELECTED PROJECTS

**Route King** 2026

React Native · TypeScript · tRPC · PostgreSQL / PostGIS · Terraform

- Real-time mobile app for electric longboarders — discover trails, record GPS rides, and broadcast your location live so your crew can spectate and send “boost” cheers. A server-authoritative event model streams over SSE so rider and spectator views never disagree.
- Sole developer end-to-end across an Expo / React Native app, a Fastify + tRPC backend, and the infrastructure — offline-first ride capture, a novel accelerometer “smoothness” engine scoring pavement roughness, and PostGIS gate-timing for competitive segments. Full IaC on DigitalOcean (Terraform) with a CI/CD + SSH deploy pipeline. Closed beta in production.

**Flowty.io** 2024

React · TypeScript · GraphQL · Node.js · PostgreSQL

- Real-time digital asset marketplace. Led the frontend for live buy/sell/trade flows — complex client state, real-time transaction updates, and a polished UI built in close partnership with design.

## EDUCATION

**General Assembly** — Software Engineering Immersive Nov 2020 – Feb 2021

500-hour full-stack program covering JavaScript, React, Node.js, Python, and SQL.
